

Week 01 Wednesday Recap

Reflections & next steps

Summary

Yesterday we:

- Went through basic and advanced git commands.
- Practiced git commits, learned the basics of PRs and learned how use remote repos.
- Used AI to generate the database schema for our library app.
- Got our initial schema design reviewed and approved.

If you've not got your schema merged yet don't worry at all. There is plenty of time to sort that today!

Key take aways

What we learned practicing yesterday.

Git

- Make sure your on the right branch before you commit!
- We'll setup team chats for your groups, post the links to PRs in these chats.
- If any comments come up address them when you can and then repost that PR for re review.

Database creation with AI

- AI loves to overimplement, it's very eager to do more.
- The requirements file is very broad covering all aspects
- Some requirments arn't relevant to the database layer
- Keep it focused on the task at hand.

What's next

- Better tooling
- JS vs TS
- How Node projects work
- How to setup your node project
- What are APIs
- What is Express?
- General structure of API projects
- REST principles

Better Tooling

Start an admin by request session on your mac.

Reason: Installing tools needed for the engineering academy.

- iTerm2
- ohMyZsh
- dBeaver Community
- Insomnia
